Lightning Protection Systems

MEET POLISH MARKET LEADER OF LIGHTNING PROTECTION SYSTEMS!

ELKO-BIS. SIMPLY THE BEST.

Quality, highest production standards and friendly customer service, this is what we have been focusing on from the very beginning, since 1998 when the business was launched. We have built a team of excellent professionals, working with full commitment and understanding of customer needs and expectations. As a result ELKO-BIS lightning protection equipment is widely known at domestic and foreign markets, protecting many prestigious buildings and thousands of residential houses.

THIS IS AN OFFER!

ELKO-BIS complex offer includes Lightning Protection Components with accessories for all kind of buildings and facilities. Quick order procedures and even 5-year warranty protection. Readiness to provide non typical custom solutions - providing design services, appropriate choice and recommendation of LPS elements to specific projects. Technical advice and trainings on a daily bases.

QUALITY COMES FIRST!

ELKO-BIS products are not only completely tested and holds necessary certificates, there are also winners of numerous industry awards. Therefore, our customers can enjoy the highest quality of lightning protection.

PROJECTS PORTFOLIO

HOUSING

Projects where Elko-Bis Lightning Protection Components being used:

- Aura Island Gdańsk
- Angel Wings, Wrocław
- Residential Estate New Bochenka, Kraków
- Francuska Park, Katowice
- Faktoria Apartments, Katowice
- Madison Apartments, Warszawa
- thousands of homes across poland

COMMERCIAL BUILDINGS

Projects where Elko-Bis Lightning Protection Components being used:

- Magnolia Shopping Centre, Wrocław
- Felicity Shopping Galery, Lublin
- Wola Park, Warszawa
- Ikea, Bielany Wrocławskie
- Bonarka Shopping Centre, Kraków
- Mazur Gate, Ełk
- Auchan, Kraków Bronowice

OFFICE BUILDINGS

Projects where Elko-Bis Lightning Protection Components being used:

- Skanska Dominikański, Wrocław
- Enterprise Park, Kraków
- Green Wings, Warszawa
- Opolska Business Park, Kraków
- Kaufland, Wrocław
- Amber Tower, Gdańsk
- Alma Tower, Kraków

POWER ENGINEERING / ENERGY SECTOR

Projects where Elko-Bis Lightning Protection Components being used:

- Kozenice Power Plant
- Power Plant Gorzów Wlkp.
- Power Plant Opole
- LNG Świnoujście
- Bio-Gas Power Plant Gdansk
- Water Power Plant Dolna Odra Szczecin
- Wind Power Plants

INDUSTRIAL BUILDINGS

Projects where Elko-Bis Lightning Protection Components being used:

- VW Factory, Września
- Ikea Industry – Wielkopolska
- 3M Factory Plant, Wrocław
- Copper Smelter KGHM, Głogów
- Bridgestone Factory Plant, Stargard
- Nestle Purina, Bielany Wrocławskie
- Michelin Factory Plant, Olsztyn

PUBLIC BUILDINGS

Projects where Elko-Bis Lightning Protection Components being used:

- Warsaw Underground
- Stadiums – m.in. Warsaw National Stadium, Łużniki Moscow,
- National Forum of Music, Wrocław
- Warsaw Medical University
- MSWiA Hospital, Warsaw
- Zespolony County Hospital, Białystok
- Parliament Building, Warsaw

Index summary on page 91

HOW TO READ CATALOG INDEXES?

NEW INDEX STRUCTURE*

TYPE

MODEL

MATERIAL

HOW TO ESTABLISH NEW INDEX (EXAMPLE)

To order **universal copper screwed roofing tile holder**:

1. Choose screwed product option index **91010101**.
2. Two last index digits to be changed into equivalent of copper option CU.
3. Your number is **91010103**.

CAT. NUM.	TYPE	VERSION
91010001	10.06	clinched
91010101	10.06/S	screwed

OC 01 OG 02 **CU 03** NI 05 LA 16

MATERIAL OPTIONS – NUMERICAL DESCRIPTION

OC 01	galvanized steel	NI 05	stainless steel	AL 09	aluminum
OG 02	hot galvanized steel	CU/OC 06	brass spacer	MS 10	brass
CU 03	copper	OC/CU 07	brass spacer	LA 16	varnished galvanized steel
MI 04	copper-bonded steel	PCV 08	PCV		

To order a specific material option, replace last two digits into material equivalent from Material Options specification.

COLOUR OPTIONS

There are five basic colour coating options. More specific options available on paid request.

				
RAL 3011	RAL 8004	RAL 8017	RAL 9005	RAL 7016
LA 3011 12	LA 8004 13	LA 8017 14	LA 9005 15	LA 7016 17

Real colours may slightly differ from presented samples.

*Presentation explaining how to create new indexes available on website

Marking Connection Clamp

To mark control connection clamp. 2 parts 3mm thick, assembled with 2 screws M6. When placing order scope of numbers need to be provided.

CAT. NUM.	TYPE	A	B	E	SCREW
97200109	72.1	20	57	7	2x M6x16

Alternative material options – change last two catalog number digits.

CU	03	AL	09
----	----	----	----

Rod- Tape Conductor Connection Clamp

To connect tape conductor with $\varnothing 22$ reinforcement foundation bar. Can be also use to connect tape conductor with earthing rod. Maximum tape size - 40x5mm. Option with cap additionally allows to connect 8-10mm wire.

CAT. NUM.	TYPE	VERSION	A	B	C	SCREW
11700101	—	without cap	42	50	$\varnothing 22$	M10x40
11701101	—	with cap	42	50	$\varnothing 22$	M10x40

Alternative material options – change last two catalog number digits.

OC	01	OG	02
----	----	----	----

Example of using Rod-tape conductor Connection Clamp to get earthing connection

GROUP II Earthing & Equipotential Bonding

Threaded Earthing Electrode - 3 meters

For vertical earthing. Mounted by successive rod installation $\varnothing 16$ or $\varnothing 20$, reaching earthing resistance ≤ 10 Ohm (for lightning protection systems). Set comes with an impact tip and clamping, suitable to connect tape or earthing rod. Great to use in energy sector, rail infrastructure and building industry.

CAT. NUM.	TYPE	A	B	C	SCREW
94103001	41.1	3000	1000	16	4x M8x16

Tape Conductor Holder

To fix tape conductor in foundation or ring type earthing. Keeping the distance of 1 meter between holders, ensures sufficient stiffness, whilst deeping the tape in foundation. Footer shape ensures accurate assembly in concrete, preventing corrosion. Maximum sectional fixing dimensions of tape 50x5mm.

Insulated Supportive Interception Air Rod

For Lightning Protection of steel roof elements and devices (skylights, air conditioners, air handling units, air handling channels). Supportive function for Aldrey rope grid between masts. Insulated End Bar of Mast, allows to place it next to devices in a less insulation distance, than is required. Choose correct mast holders depending on assembly place e.g mast holder 96000201 for wall mounting.

Tripod Insulated Supportive Interception Mast

For Lightning Protection of steel roof elements and devices (skylights, air conditioners, air handling units, air handling channels). Tripod concrete base gives appropriate wind resistance. Free standing mast with total weight up to 138kg. It is recommended to use pads under concrete base. Option 94308222 for tar board roofs and option 94308221 for membrane roofs. Supportive function for Aldrey rope grid between masts. Insulated End Bar of Mast, allows to place it next to devices in a less insulation distance, than is required.

Insulated High Voltage Cable

To discharge strike electric stream. Use at places where appropriate insulation distance from protected elements can not be kept or close to communication strings. Cable construction guarantee insulation distance of 75cm. Can be directly lead on electric devices. Resistant to weather conditions. Copper wire. Projects support on: export@elkobis.com.pl. Detailed technical features: www.elkobis.com.pl/high-voltage-cable.

Product sizes can be changed.

CAT. NUM.	TYPE	A	B
30000199	300.1	35 mm ²	23 mm

High Voltage Cable End Tip

For High Voltage Cable connections with horizontal conductor or directly with earthing electrode. Brass tip allows connection to copper or steel construction, being resistance to weather conditions. In a set with screw protection glue and heat shrink tubing.

NOTE: End Tip assembly according to instruction.

Product sizes can be changed.

ELKO-FIX Assembly Adhesive

Universal and flexible glue. Can be used with different materials and surfaces (concrete, steel, plastics etc excluding PE, PP, silicone and teflon) Recommended to fix/bond:

- concrete base holders (e.g 93000211)
- plate roof holders (e.g 91500101) flash roofs covered in steel sheets.

Follow instructions on the packaging. Endurance test recommended.

CAT. NUM.	TYPE	FEATURES	CAPACITY
99300199	93.1	flexible after hardening, sealant	290 ml

Polyurethane Adhesive

For Tar Board bonding of concrete bases.

CAT. NUM.	TYPE	WEIGHT
99410199	–	0,8 kg

Technical Vaseline

To protect screw connections. Apply to all connections and screws using paintbrush for example. Use of Technical Vaseline is essential to keep products warranty.

CAT. NUM.	TYPE	WEIGHT
99500199	95.1	0,5 kg

Mechanical Wire Straightening Tool - 9 rolls

For mechanical wire conductor straightening with manual drive. Can be used with Ø 6-8 mm wires. It is recommended to use supportive straightening tool(98600101 - see page 70). Renting option available. More info at www.elkobis.com.

CAT. NUM.	TYPE	WEIGHT
10000199	100.1	14 kg

Mechanical Tape Conductor Straightening Tool

For mechanical tape conductor straightening. Can be used with 20-40 mm tapes, 4 mm thick. Renting option available. More info at www.elkobis.com.

CAT. NUM.	TYPE	WEIGHT
10001199	100.2	20 kg

Mechanical Tape&Wire Straightening Tool

For mechanical tape and wire conductor straightening. Light and mobile with manual drive. Apply tape max 40x4 and wire Ø 6-8 mm. Option with electric drive also available. It is recommended to use supportive straightening tool (98600101 - see page 70). More info at www.elkobis.com.

DO YOU KNOW, THAT...

Benjamin Franklin

For centuries lightning strikes were attributed to magical background?

It was only eighteenth century when hypothesis on electrical nature of lightning strikes had been put forward, and in 1750. Benjamin Franklin proved the electrical nature of lightning. He is also considered as the inventor of lightning rod. His most famous experiment was to release the kite during a thunderstorm, allowing him to discover that effective protection against lightning strikes is earthing.

In Poland Lightning Rods appeared thanks to initiative of King Stanislaw August Poniatowski. In 1783 Town Hall in Rawicz, and soon after Royal Castle in Warsaw were equipped with lightning rods.

HOW LIGHTNING STRIKES ARISE?

The storm cloud creates a spatial electric charge, which is separated. Positive charge accumulates in the upper parts of the cloud, the negative charge - in the lower parts. Between this charges aggregation, strong increasing electric field appears, due to the separation of successive charges. When the value of created field exceeds the limit, non-conductive air becomes a conductor. Nature tends to balance, so equipotential bonding is through snap of huge energy. At this snapping point, appears electrical discharge - called lightning.

There are 4 types of Lightning Discharges:

- between clouds
- inside the clouds
- cloud – an air
- cloud – an earth

The last one are the most dangerous for humans. Despite lasting less than a second, may cause extensive damages. Every year in Poland there has been 500 000 discharges, killing dozens of people, many being seriously injured and property damages are counted in millions.

HOW LIGHTNING PROTECTION SYSTEM WORKS?

Lightning Protection System has to adopt lightning current and bring it the shortest way to the earth-ing. Lightning Protection System can be divided into three zones: roof air termination/conductors, down conductors and earth electrodes.

- Air Termination Zone - contains the largest amount of different mounting components, among others vertical and horizontal conductors for variety of roof types, walls and constructions.
- Down Conductors Zone - includes equipment for wall mounting in different techniques: surface mounted, inside insulation surface, tensioning systems.
- Earthing Zone- a group of so-called atrophic works, invisible for eyes ,being sunk in the ground. Properly made earthing is crucial to functioning of Lightning Protection System. Standard norm EN 62305 defines two types of earthing.

Earthing Type A - contains horizontal and vertical conductors, externally assembled and connected to each down conductor.

Earthing Type B - external ring type earthing , at least 80% of its length stays in contact with ground, includes also foundation and lattice earthing. Grounding resistance for Lightning Protection Systems should not exceed 10Ω at each control joint. The earth resistance must be confirmed /comply with post- implementation electric measurements.

ATTENTION!

Currently, terms and conditions of insurance contracts includes requirement for a building to be Lightning protected, extending its scope to surge installation. Also, Construction Law requires Lightning Protection System according to current standards.

UP TO DATE LEGAL REGULATIONS DEFINING LIGHTNING PROTECTION

Regulation issued by Ministry of Infrastructure and Development dated 17 July 2015. regarding technical conditions to be met by buildings and their location (Dz.U. No. 75 pos 690 with amendments) This is main legislation act concerning building equipping in the Lightning Protection System where W53.2 says: It is obligatory to equipped building in LPS - Lightning Protection System . This obligation applies to buildings listed in polish norm /standards of LPS.

CURRENT POLISH LPS STANDARDS ISSUED BY REGULATION OF INFRASTRUCTURE AND DEVELOPMENT MINISTRY DATED 10 DECEMBER 2010		
NUMBER	TITLE	SCOPE
62305-1:2008	Lightning Protection - Part 1: General Principles	Lightning Protection of buildings including their content (humans and installations) together with service devices attached to object. Recommendations do not include: ▪ railway devices ▪ vehicles, ships, aircrafts, offshore installations ▪ high pressure underground pipelines ▪ pipelines, power and telecommunication lines not connected to object.
62305-2:2008	Lightning Protection - Part 2: Risk Management	Estimation of risk caused by lightning discharges in buildings and service devices. Choice of LPS protection levels.
62305-3:2009	Lightning Protection - Part 3: Physical damage to structures and life hazard	Requirements for physical structure damage protection using LPS, together with protection of living beings against contact and stepper voltage electric shock nearby lightning device. ▪ Designing, implementation, control and maintaining of LPS at buildings of any height. ▪ Living beings protection against contact and stepper voltage shock.
62305-4:2009	Lightning Protection - Part 4: Electrical and electronic systems within structures	Designing, implementation, control and maintaining of LEMP protection measures systems for internal electric and electronic devices, due to permanent damage risk reduction caused by lightning electromagnetic impulse LEMP

REMEMBER!

Starting from designing, through implementation process up to object commissioning, lightning protection designer should coordinate work of all those persons, associated with design of other installations, which may significantly affect layout of lightning protection system. Designer and the contractor has a duty to select appropriate elements.

QUALITY STANDARDS

Risk assessed with direct lightning flash to an element of lightning protection system (thermal erosion, cables over-heating, dynamic actions) together with market appearance of low quality components, led to introduction of quality standards

Requirements to be met by lightning protection elements were included in the multi-sheet European Standard EN 50164, being recalled in PN-EN 62305-3: 2009 / A11 norm regulated by Infrastructure Ministry. Current, but not translated into Polish and do not recalled by Infrastructure Ministry, are series of European Standards EN 62561 2011 - 2012. Elko-Bis products are regularly tested according to their requirements.

PN-EN 50164 STANDARDS LIST

Standard Number*	Standard Title
PN-EN 50164-1:2010	Lightning Protection Components (LPC)- Part 1: Requirements for connection components
PN-EN 50164-2:2010	Lightning Protection Components (LPC)- Part 2: Requirements for conductors and earth electrodes
PN-EN 50164-3:2010	Lightning Protection Components (LPC)- Part 3: Requirements for isolating spark gaps
PN-EN 50164-4:2010	Lightning Protection Components (LPC)- Part 4: Requirements for conductor fasteners
PN-EN 50164-5:2010	Lightning Protection Components (LPC)- Part 5: Requirements for earth electrode inspection housing and earth electrode seals
PN-EN 50164-6:2010	Lightning Protection Components (LPC)- Part 6: Requirements for lightning strike counters
PN-EN 50164-7:2010	Lightning Protection Components (LPC)- Part 7: Requirements for earthing enhancing compounds

* EN 50164 standards have been replaced by EN 62561 (however, they have not been translated into Polish and are not valid according to standardization act, also are not recalled in the regulation Annex of Infrastructure Minister (Journal of Laws No. 239 of 2010. Item. 1597).

Tests

Harmonisation of standards obligate manufacturers of lightning protection systems to carry out compliance tests described in BS EN 50164-1: 2010 Standard. At Elko-Bis we attach great importance to tests, knowing that their results are crucial to health and property protection of our customers. As a result, they receive highest quality products, they can rely on.

LIGHTNING CURRENT PULSE PARAMETERS CONSIDERED FOR STUDIES				
Connection load capacity	$I_{imp} \pm 10\%$ [kA]	$W/R \pm 35\%$ [kJ/Ω]	T_1 [μs]	T_d [ms]
H connection for considerable current capacity	100	2500	≤50	≤2
N connection for regular current capacity	50	630	≤50	≤2

Note: The parameters specified in the table can be achieved when using bi-exponential current with time T2 equaling 350 μs in accordance with PN-EN 62305-1.

CONNECTORS

Intension of Lightning Connector is to connect two or more conductors, so the transfer of lightning current charge, is held without excessive damage to air terminals or installations. Connectors should be solid, durable and safe for people and nearby devices.

Elko-Bis in pursuance of EN 60068-2-52: 1996 standard, at first place subject connectors to ageing process in the salt chamber, being influenced by salt mist, sulfur humid atmosphere and ammonia. Another step is electric testing. Each sample is subjected to triple current pulse loading. **Manufacturer declares connection load capacity (H or N).**

Air Termination and Earthing

These are the most important elements of Lightning Protection System. Case studies of lightning occurrence **and problem of temperature increase as a result of material resistance**, have established the minimum cross-section of lightning conductors, which is 50 mm², and 90 mm² in case of tape earthing conductors (**option - galvanized steel**). Standard also specifies metal types, that can be used for air termination and earthing elements. Basic requirements, air termination and earth electrodes test methods are specified in PN-EN 50164-2. The most important standard aspects for air termination and earthing are: their minimum cross-section, anti-corrosive protection and mechanical resistance as well as material resistivity.

LIGHTNING PROTECTION SYSTEM DESIGNERS GUIDEBOOK

Who can design, implement and control Lightning Protection Systems?

Lightning Protection investment involvement, require professional training to perform independent technical functions in the construction industry. Rules of getting construction license are specified in the Act from 7th July 1994. published in Journal of Laws 1994 no. 98 item. 414 and the subsequent amendment of this Act. In Chapter 3, Art. 17. where participants taking and responsible for decisions in the construction process, are listed. These include: the designer, contractor and investment supervisor. Each of them must hold construction license, determining appropriate permission to undertaken work. In addition, persons carrying out construction projects are required to associate in the Chamber of Civil Engineers.

Lightning Protection Class choosing procedures

Risk assesment

The first stage of designing lightning protection systems is risk analysis. The calculation method has been included in the volume no. 2 of PN-EN 62305-4

Calculation method

The risk calculation consider factors inside and outside the facility related to direct lightning strikes in the facility, out of the facility and in power lines and telecommunications lines connected to the facility. The risk calculation algorithm considers over a hundred factors related to dimensions and building equipment, type of utilities, loss of life of living beings, loss of goods and services, as well as other parameters. **Many designers perceive the calculation method as a controversial issue.**

Computer software

To assist in this respect, the market offers computer software. We should remember however that many of them e.g. the program attached to PN-EN62305 IEC Risk Calculator impose a set of substantial restrictions and cannot be used with regard to complex facilities. At present, when assessing risk, we cannot use algorithms and computer programs developed on the basis of previously applicable standards, e.g. lightning hazard factor in accordance with PN-86-E-05003/01.

TECHNICAL
INFORMATION

BELOW TABLE SHEET PRESENTS PKOO PROPOSAL FOR PROTECTION LIGHTNING CLASS DETERMINATION

ITEM	DESCRIPTION OF FACILITY		PROTECTION CLASSES/LEVEL		
	GENERAL FEATURE	TYPE OR INTENDED USE ^{a)}	I	II	III-IV
1.1	Public facilities in conditions of normal hazard ^{a)}	Administration buildings			x
1.2		Cinemas, theaters, schools, kindergartens			x
1.3		Churches with a tower of up to 20m			x
1.4		Museums and historic buildings and buildings of cultural value			x
1.5		Covered markets, entertainment arenas, etc...			x
1.6		Market places			x
1.7		Close sports facilities			x
1.8		Swimming pools			x
1.9		Garages (medium-sized and large)			x
2.1	Industrial facilities and craft workshops in conditions of normal hazard	Office			x
2.2		Production, warehouse ^{a)}			x
2.3		Food-related			x
3.1	Accommodation	Hotels, inns, guesthouses			x
3.2		Large hotels		x	
3.3		Hostels, night shelters		x	
4.1	Railway facilities	Shipment facilities (railway stations, platforms) ^{a)}			x
4.2		Administration buildings			x
4.3		Warehouses			x
5.1	Air facilities	Building sections with explosion zones	x		
5.2		Airline supervision and handling centers	x		
5.3		Other air supervision center		x	
5.4		Check-in buildings ^{a)}			x
5.5		Administration buildings			x
5.6		Hangars, warehouses			x
6.1	Health and care facilities	Intensive care facilities	x		
6.2		Nursing homes and residential homes		x	
6.3		Hospital pavilions			x
6.4		Administration buildings			x
7.1	Large-format facilities	Buildings higher than 30 m		x	
7.2		Churches with a tower of more than 20 m		x	
8.1	Residential buildings	Single-family houses			x
8.2		Multi-family houses			x
9.1	Agricultural facilities	Farm buildings			x
10.1	Facilities with explosion or fire hazard	Explosives manufacturing and storing units	x		
10.2		Ammunition depots	x		
10.3		Pyrotechnic facilities	x		
10.4		Building sections with ex zones	x		
10.5		Sewage treatment plants	x		
10.6		Gas/combustible liquid systems	x		
10.7		Pyrotechnic facilities		x	
10.8		Inflammable buildings		x	
11.1	Technical service facilities	Power engineering facilities		x	
11.2		Telecommunications facilities		x	
11.3		IT facilities		x	
11.4		Technical supervision center		x	

a) in the conditions of increased hazard (facilities situated on hills or containing multi-person rooms, structures or materials which are not resistant to heat, etc), it is necessary to increase the protection level to class II, and in the case of facilities sections which contain ex zones or devices sensitive to electromagnetic impact – to class I.

b) It is necessary to pay special attention to effectiveness of internal protection means (protection of electric devices and electronics against overvoltage).

ELKO-BIS CALCULATION SHEET AND TABLES

We suggest using a trial version of Elko-Risk H1 to calculate risk for H1 case (cottage house) in accordance with PN-EN 62305 standard. To download the sheet, please visit www.elkobis.com. Designers expect simplified methods of specifying lightning protection class. Alternatively, following other European countries, it is possible to use the table which is PKOO's suggestion presented below.

H [m]	LPS I		LPS II		LPS II		LPS IV	
	SHIELDING ANGLE A	PROTECTIVE RADIUS A [m]	SHIELDING ANGLE A	PROTECTIVE RADIUS A [m]	SHIELDING ANGLE A	PROTECTIVE RADIUS A [m]	SHIELDING ANGLE A	PROTECTIVE RADIUS A [m]
1	70	2,75	73	3,27	76	4,01	79	5,14
2	70	5,49	73	6,54	76	8,02	79	10,29
3	66	6,74	71	8,71	74	10,46	76	12,03
4	62	7,52	68	9,90	72	12,31	74	13,95
5	59	8,32	65	10,72	70	13,74	72	15,39
6	56	8,90	62	11,28	68	14,85	71	17,43
7	53	9,29	60	12,12	66	15,72	69	18,24
8	50	9,53	58	12,80	64	16,40	68	19,80
9	48	10,00	56	13,34	62	16,93	66	20,21
10	45	10,00	54	13,76	61	18,04	65	21,45

DESIGNING METHODES OF LIGHTNING PROTECTION SYSTEMS

Methods of dimensioning the protection zones have remained unchanged in terms of their name for many years. Applicable since 2008, PN-EN 62305 standard introduced essential changes concerning dimensioning methods.

Flash roofs

With regard to flat roof surfaces, the loop method in the form of nets of horizontal air terminals having the dimensions specified in the standard for each LPS class is applied. This method is applied for simple facilities devoid of elements elevated above them.

Sloping roofs and others

When it comes to protection of roof slopes of various height with diverse facilities and systems on the surface of the roof, two methods are applied, that is a rolling ball and protective angle. Both methods are equivalent in terms of reference plane height (H) specified in PN-EN 62305 standard.

Protective angle method

for LPS IV class, the method of protective angle (shielding angle) can be used for the reference plane height up to 60m. Most frequently the reference plane height is the height of the mast which protects the facility when the mast and the facility are at the same level. When the lightning mast and the facility are protected at various levels, the reference plane height is the total of mast height and level difference. The table below shows protection angle and radiuses for the method of shielding angle in LPS class and series of masts manufactured by Elko-Bis (see groups: air termination, interception masts, spires, insulated air terminals in the catalog from page 48).

Method of rolling sphere

The method of rolling sphere is an all-purpose method relevant to all types of civil structure. It is concerned with creating protection zones by basing the ball with a radius specified by the standard (in accordance with LPS class) on one or many peak points of lighting masts. The volume under the zone of this ball under the mast or between masts may be considered a lightning protection zone (subject to facilities with ex zone – then the zones must be dimensioned in a way that the distance between them is not lower than 1 m).

Example of protection zone for 6m interception mast.

SEPARATION DISTANCE IN LIGHTNING PROTECTION

Separation Distance – distance to be kept in order to avoid spark snap.

Designing or manufacturing the external lightning protection device, we should pay special attention to protection of devices on roofs against effects of direct lightning discharge and a jump of charge from lightning protection system to protected device. Multisheet PN-EN 62305 standards explicitly state that: "All roof devices made of insulating or conductive material which include electric equipment and/or equipment serving to convert information, should be located in the protected space of air terminals".

Separation distance step by step

using one of the methods (rolling ball or shielding angle), it is necessary to arrange air terminals and/ or devices in a way that all elements of the protected device are "hidden" in designated protected zones. This way we can protect the device against direct discharge, and by calculating a required insulating clearance for the given place, that is the distance we need to assure to avoid the spark-over, we protect the device not only on the roof but also internal systems against overvoltage caused by the flow of lightning current through the system.

The insulating clearance S in the simplest case can be calculated on the basis of the pattern below:

$$S \geq k_i \frac{k_c I}{k_m}$$

k_i – is fixed and depends on lightning protection class the system use.

k_c – accepts numerical values ranging from 1 to $1/n$ depending on certain condition compliance, where n is the number of down conductors.

k_m – accepts numerical value 1 for air calculation and 0,5 for brick or concrete. For our production Separation Bars 79.075÷200 (page 59) 0,7 numerical value to be taken.

In case of expanded external lightning protection systems, below pattern shall apply:

$$S \geq \frac{k_i}{k_m} (k_{c1} I_1 + k_{c2} I_2 + \dots + k_{cn} I_n)$$

Elko Bis Calculation Sheet

On website there is calculation sheet called "Separation distance calculation" calculating separation distance based on above mathematical patterns.

Emergencies

When the calculated insulating clearance for air is lower than 75 cm, the standard solutions do not let us keep such a clearance, be it for structural or aesthetic reasons, our company provides an insulating high-voltage system (catalog page 85) based on the high-voltage wire 300.1 and a wide range of holders, fittings and interception masts which we are constantly expanding.

Is there a problem? We will handle it!

When the calculated insulating clearance is higher than 75cm, the representative of our helpdesk will help you find the solution! Please do not hesitate to contact our specialists. Their contact data can be found on www.elkobis.com.pl/contact in the section designing-manufacturing-assembly or just send an e-mail message to export@elkobis.com.pl.

BE AWARE!

Lightning protection is an important part of any newly built building, so do not leave it to last stage. Doing so, it may appear that costs of its implementation, are overestimated. You may then find that you are required expensive items, that purchase could have been avoided if they were properly coordinated at all phases of construction project.

We invite you to contact our technical department export@elkobis.com.pl. We provide professional assistance at every stage of the investment, as well as the optimization of already finished projects. In case of difficult installations we provide free on-site verification in order to choose the best solution.

DESIGN USING ELKO-BIS CAD APPLICATION!

To meet designers needs , we have created an innovative tool to help you design and cost estimate lightning protection systems: **The ELKO-BIS CAD**.

ELKO-BIS CAD application is the first Polish software to design lightning protection systems within environment of graphics applications. It was created through cooperation of experienced ELKO-BIS designers and IT specialists.

WHY ELKO-BIS CAD APPLICATION IS SO SPECIAL?

- it is the first Polish, lightning protection systems author design overlay
- it is **free**, and user receives a lifetime license
- is recommended by Polish Lightning Protection Committee
- has been awarded the **prestigious Golden Volta** of International **ENERGETAB** Fairs
- It was created through cooperation of experienced ELKO-BIS designers and IT specialists
- is written in C ++ and works with many well-known market CAD applications including: AutoCAD, BricsCAD, ZWCAD, 4M CAD progeCAD, CADopia, Star!CAD, GstarCAD, Intersoft IntelliCAD, BitCAD, Arcadia, IntelliPlus, JetCAD, ARES
- contains a built-in lightning tutorial based on existing standards
- contains a built-in products library and PDF catalog
- is a user-friendly
